

A. Object Description

For my Key Away movie website, I'm creating a Movie object to represent each film in the search results.

What it represents:

Each Movie object represents a film that users can discover through keyword search. Right now I have three French movies displayed, and using objects will make it easier to work with their data.

Properties (data to store):

- title: the movie's name (string)
- director: who directed it (string)
- year: when it was released (number)
- runtime: length in minutes (number)
- rating: IMDb score out of 10 (number)

Methods (actions it can perform):

- getInfo(): returns a formatted string with all the movie details
- isLongMovie(): checks if runtime is over 120 minutes, returns true/false
- getRatingLevel(): returns "high", "medium", or "low" based on rating score

Why these are needed:

Users need to see movie information clearly. The getInfo() method makes it easy to display all details in a consistent format. The isLongMovie() method helps users find shorter films if they want a quick watch. The getRatingLevel() method can be used to highlight highly-rated movies or filter by quality. These methods make it easier to work with movie data and display it to users in useful ways.

<<Object Type: Movie>> Movie1	
Properties:	
Data Value	
----- -----	
title Gemma Boveri	
director Anne Fontaine	
year 2014	
runtime 99	
rating 6.4	
Methods:	
Task Purpose	
----- -----	
getInfo() : Return formatted movie details	
isLongMovie() : Return true if runtime > 120 min	
getRatingLevel() : Return rating category	

<<Object Type: Movie>> Movie2	
Properties:	
Data Value	
----- -----	
title Young & Beautiful	
director François Ozon	
year 2013	
runtime 95	
rating 6.7	
Methods:	
Task Purpose	
----- -----	
getInfo() : Return formatted movie details	
isLongMovie() : Return true if runtime > 120 min	
getRatingLevel() : Return rating category
